FOREWORD

The Publication of Waverley in 1814 marked the emergence of the modern novel in the western world. It is difficult now to recapture the impact of this and the following novels of Scott on a readership accustomed to prose fiction either as picturesque romance, 'Gothic' quaintness, or presentation of contemporary manners. For Scott not only invented the historical novel, but gave it a dimension and a relevance that made it available for a great variety of new kinds of writing. Balzac in France, Manzoni in Italy, Gogol and Tolstoy in Russia, were among the many writers of fiction influenced by the man Stendhal called 'notre père, Walter Scott'.

What Scott did was to show history and society in motion: old ways of life being challenged by new; traditions being assailed by counter-statements; loyalties, habits, prejudices clashing with the needs of new social and economic developments. The attraction of tradition and its ability to arouse passionate defence, and simultaneously the challenge of progress and 'improvement', produce a pattern that Scott saw as the living fabric of history. And this history was rooted in place; events happened in localities still recognisable after the disappearance of the original actors and the establishment of new patterns of belief and behaviour.

Scott explored and presented all this by means of stories, entertainments, which were read and enjoyed as such. At the same time his passionate interest in history led him increasingly to see these stories as illustrations of historical truths, so that when he produced his final Magnum Opus edition of the novels he surrounded them with historical notes and illustrations, and in this almost suffocating guise they have been reprinted in edition after edition ever since. The time has now come to restore these novels to the form in which they were presented to their first readers, so that today's readers can once again capture their original power and freshness. At the same time, serious errors of transcription, omission, and interpretation, resulting from the haste of their transmission from manuscript to print can now be corrected.
