New class of sixth-order nonhomogeneous \( p(x) \)-Kirchhoff problems with sign-changing weight functions

https://doi.org/10.1515/anona-2020-0172
Received January 17, 2020; accepted January 31, 2021.

Abstract: In this paper, we prove the existence of multiple solutions for the following sixth-order \( p(x) \)-Kirchhoff-type problem

\[
\begin{align*}
- M \left( \int_{\Omega} \frac{1}{p(x)} |\nabla \Delta u|^{p(x)} \, dx \right) \Delta^{3}_{p(x)} u &= \lambda f(x) |u|^{q(x)-2} u + g(x) |u|^{r(x)-2} u + h(x) \quad \text{in} \quad \Omega, \\
u &= \Delta u = \Delta^{2} u = 0, \quad \text{on} \quad \partial \Omega,
\end{align*}
\]

where \( \Omega \subset \mathbb{R}^{N} \) is a smooth bounded domain, \( N > 3 \), \( \Delta^{3}_{p(x)} u := \text{div} \left( \Delta(\nabla \Delta u)^{p(x)-2} \nabla u \right) \) is the \( p(x) \)-triharmonic operator, \( p, q, r \in C(\Omega) \), \( 1 < p(x) < \frac{N}{3} \) for all \( x \in \overline{\Omega} \), \( M(s) = a - bs^{\gamma} \), \( a, b, \gamma > 0 \), \( \Lambda > 0 \), \( g : \Omega \times \mathbb{R} \rightarrow \mathbb{R} \) is a nonnegative continuous function while \( f, h : \Omega \times \mathbb{R} \rightarrow \mathbb{R} \) are sign-changing continuous functions in \( \Omega \). To the best of our knowledge, this paper is one of the first contributions to the study of the sixth-order \( p(x) \)-Kirchhoff type problems with sign changing Kirchhoff functions.

Keywords: Variable exponents; Kirchhoff type problems; \( p(x) \)-triharmonic operator; Sign-changing functions; Concave-convex terms; Ekeland’s variational principle; Multiple solutions

1 Introduction

Let \( \Omega \subset \mathbb{R}^{N} \) be a smooth bounded domain and \( N > 3 \). This paper deals mainly with the following sixth-order \( p(x) \)-Kirchhoff-type problem

\[
\begin{align*}
- M \left( \int_{\Omega} \frac{1}{p(x)} |\nabla \Delta u|^{p(x)} \, dx \right) \Delta^{3}_{p(x)} u &= \lambda f(x) |u|^{q(x)-2} u + g(x) |u|^{r(x)-2} u + h(x) \quad \text{in} \quad \Omega, \\
u &= \Delta u = \Delta^{2} u = 0, \quad \text{on} \quad \partial \Omega,
\end{align*}
\]
where \( p, q, r \in C(\overline{\Omega}), 1 < p(x) < \frac{N}{3} \) for all \( x \in \overline{\Omega} \), \( M(s) = a - bs^{-\gamma}, a, b, \gamma > 0, \lambda > 0, g : \Omega \times \mathbb{R} \to \mathbb{R} \) is a nonnegative continuous function, \( f, h : \Omega \times \mathbb{R} \to \mathbb{R} \) are assumed to be continuous functions which may change sign in \( \Omega \), and
\[
\Delta_{p(x)}^2 u := \text{div} \left( \Delta(|\nabla u|^{p(x)-2} \nabla u) \right)
\]
is the \( p(x) \)-triharmonic operator which is not homogeneous and is related to the variable exponent Lebesgue space \( L^{p(x)}(\Omega) \) and the variable exponent Sobolev space \( W^{1,p(x)}(\Omega) \). These facts imply some difficulties. For example, some classical theories and methods, including the Lagrange multiplier theorem and the theory of Sobolev spaces cannot be applied.

Such problems are called nonlocal problems because of the presence of the function \( M \), which implies that the equation contains an integral over \( \Omega \), and is no longer pointwise identity. This causes some mathematical difficulties which make the study of such a problem particularly interesting. We call (1.1) a sixth order Kirchhoff type equation because it is related to the stationary analog of the equation
\[
\rho \frac{\partial^2 u}{\partial t^2} - \left( \frac{p_0}{h} + \frac{E}{2L} \int_0^L \left| \frac{\partial u}{\partial x} \right|^2 \, dx \right) \Delta^2 u = 0,
\]
where \( \rho, p_0, h, E, L \) are constants which represent some physical meanings respectively. Eq. (1.2) extends the classical D’Alembert wave equation by considering the effects of the changes in the length of the strings during the vibrations.

This kind of nonlocal problem also appears in other fields, for example in nonlinear elasticity theory and in modelling electrorheological fluids [39, 40] and from the study of electromagnetism and elastic mechanics [25, 43], and raises many difficult mathematical problems. After this pioneering models, many other applications of differential operators with variable exponents have appeared in a large range of fields, such as image restoration and image processing [8, 29]. We refer the reader to [1, 21, 34] for an overview of references on this subject.

Throughout this paper, unless otherwise stated, we shall always assume that exponent \( p(x) \) is continuous on \( \overline{\Omega} \) with
\[
p_\gamma := \inf_{\Omega} p(x) \leq p(x) \leq p_* := \sup_{\Omega} p(x) < \frac{N}{3}
\]
and \( p^*(x) \) denotes the critical variable exponent related to \( p(x) \), defined for all \( x \in \overline{\Omega} \) by the pointwise relation
\[
p^*(x) = \frac{Np(x)}{N - 3p(x)}.
\]
In the following, we denote by \( [W_0^{1,p(x)}(\Omega)]' \) the dual space of \( W_0^{1,p(x)}(\Omega) \) and \( q'(x) = \frac{p^*(x)}{p^*(x) - 1} \) the conjugate exponent of \( p^*(x) \).

Now, we introduce some conditions for problem (1.1) as follows:

\[(H_1) : 1 < q(x) < p_\gamma \leq p_* < (\gamma + 1)p_\gamma \leq (\gamma + 1)p_* < r(x) < p^*(x) \text{ for all } x \in \overline{\Omega}, \text{ where } \gamma \text{ is a positive constant;}
\]
\[(H_2) : f \in L^{q(x)}(\Omega), 0 \leq g \in L^{r(x)}(\Omega) \text{ and } h \in L^{q^*(x)}(\Omega) \cap L^{\infty}(\Omega) \text{ for all } x \in \overline{\Omega}, \text{ with}
\]
\[
q_0(x) = \frac{p^*(x)}{p^*(x) - q(x)}, \quad r_0(x) = \frac{p^*(x)}{p^*(x) - r(x)}
\]
where \( \eta, \mu \) are small positive numbers.
\[(H'_2) : f \in L^{q(x)}(\Omega) \cap L^{\infty}(\Omega) \text{ and } g \in L^{r(x)}(\Omega) \cap L^{\infty}(\Omega) \text{ with}
\]
\[
q_0(x) = \frac{p^*(x)}{p^*(x) - q(x)}, \quad r_0(x) = \frac{p^*(x)}{p^*(x) - r(x)}.
\]
Furthermore, there exists non-empty open domain \( \Omega_0 \subset \Omega \) such that \( g(x) > 0 \) in \( \Omega_0 \).

In recent years, great attention has been paid to the study of Kirchhoff problems. This brought new mathematical difficulties that made the study of Kirchhoff type equations particularly interesting. A typical prototype for \( M \), due to Kirchhoff in 1883, is given by
\[
M(t) = a + b \tau^{a-1}, \quad a, b \geq 0, \quad a + b > 0, \quad t \geq 0, \tag{1.3}
\]
and

\[
\begin{cases}
    a \in (1, +\infty) & \text{if } b > 0 \\
    a = 1 & \text{if } b = 0,
\end{cases}
\]

when \( M(t) > 0 \) for all \( t \geq 0 \), Kirchhoff problems are said to be nondegenerate and this happens for example if \( a > 0 \) and \( b \geq 0 \) in the model case (1.3). Otherwise, if \( M(0) = 0 \) and \( M(t) > 0 \) for all \( t > 0 \), the Kirchhoff problems are called degenerate and this occurs in the model case (1.3) when \( a = 0 \) and \( b > 0 \). In particular, Chen-Kuo-Wu in [7] studied the following semilinear boundary problem and proved by the Nehari manifold and fibering maps, the existence of multiple positive solutions

\[
\begin{cases}
    \left( a + b \int_{\Omega} |\nabla u|^2 \, dx \right) \Delta u = \lambda f(x)|u|^{q-2}u + g(x)|u|^{r-2}u & \text{in } \Omega, \\
    u = 0, & \text{on } \partial \Omega,
\end{cases}
\]

where \( \Omega \) is a smooth bounded domain in \( \mathbb{R}^N \), with \( 1 < q < 2 < p < 2^* = \frac{2N}{N-2} \) and the parameters \( a, b, \lambda > 0 \). The functions \( f(x), g(x) \in C(\partial \Omega) \) may change sign on \( \Omega \).

The study of Kirchhoff type equations has already been extended to the case involving the \( p \)-Laplacian operator of the following form

\[
\begin{cases}
    -M \left( \int_{\Omega} |\nabla u|^p \, dx \right) \Delta_p u = \lambda f(x)|u|^{q-2}u + g(x)|u|^{r-2}u + h(x) & \text{in } \Omega, \\
    u = 0, & \text{on } \partial \Omega.
\end{cases}
\]  

Chen-Huang-Liu [6] studied the nonhomogeneous case of (1.4) (that is \( h(x) \neq 0 \)), \( \lambda > 0 \), \( M(s) = a + bs^k \), \( a, b > 0 \), \( k \geq 0 \), \( f(x), g(x) \) and \( h(x) \) are continuous functions which may change sign on \( \Omega \). The parameters \( p, q, r \) satisfy \( 1 < q < p < p(k+1) < r < p^* = \frac{Np}{N-p} \). Using the Mountain pass theorem and Ekeland’s variational principle, they showed that problem (1.4) has at least two positive solutions when \( \lambda \) is small enough.

For \( h(x) \equiv 0 \), Huang-Chen-Xiu [27] studied problem (1.4) where \( M(s) = a + bs^k \), \( 1 < q < p < p^* \), and proved that the problem has at least one positive solution when \( r > p(k+1) \) and the functions \( f(x), g(x) \) are nonnegative. Motivated by [27], Li-Mei-Zhang [30] considered \( M(s) = a + bs \), \( 1 < q < p < p^* \) and they proved the existence of multiple nontrivial nonnegative solutions by using the Nehari manifold when the weight functions \( f(x), g(x) \) change their signs (see also [22]).

However, many papers generalized the constant case to include the \( p(x) \)-Laplacian operator, e.g., in [9], using variational methods, we investigated a nonlocal \( p(x) \)-Laplacian Dirichlet problem

\[
\begin{cases}
    -M \left( \int_{\Omega} \frac{1}{p(x)} |\nabla u|^{p(x)} \, dx \right) \Delta_{p(x)} u = K(x, u) & \text{in } \Omega, \\
    u = 0 & \text{on } \partial \Omega,
\end{cases}
\]

and we showed via the mountain pass theorem combined with the Ekeland variational principle the existence of at least two distinct, non-trivial weak solutions in the case that

\[
K(x, u) = \lambda \left( a(x)|u|^{q(x)-2}u + b(x)|u|^{r(x)-2}u \right),
\]

where \( \lambda \) is a parameter and \( a(x), b(x), a(x) \) and \( \beta(x) \) satisfy suitable hypotheses and under some suitable conditions on \( M \).

Recently, Hamdani et al. in [24] studied (1.5) when \( M(s) = a - bs \) and \( K(x, u) = \lambda |u|^{p(x)-2}u + g(x, u) \), where \( \lambda \) is a real parameter, \( a, b > 0 \) are constants and \( g \) is a continuous function satisfies the classical (AR) condition. If \( 1 < p^- < p(x) < p^* < 2p^- < q^- < q(x) < p^*(x) \) then the authors proved the existence and
Theorem 1.1. Assume that the conditions (H1) and (H2) hold. Then there exist \( \bar{\lambda}, \delta > 0 \) such that, for each \( \lambda \in (0, \bar{\lambda}) \), problem (1.1) admits at least two nontrivial weak solutions in \( X \) provided that \( \|h\|_{p(x)/p(x)-1}^* < \delta \).

Theorem 1.2. Let \( h(x) \equiv 0 \) for all \( x \in \Omega \) and assume that the conditions (H1) and (H2) hold. Then there exists \( \bar{\lambda} > 0 \) such that, for each \( \lambda \in (0, \bar{\lambda}) \), problem (1.1) admits at least two nontrivial weak solutions in \( X \).

The paper is organized as follows. In Section 2, we give the notations and recall some useful lemmas concerning the variable exponent Lebesgue and Sobolev spaces. In Section 3, we give some lemmas which are important for the proofs of our main results. In Section 4, we prove Theorem 1.1 (we omit the proof of Theorem 1.2 since it is very similar).

2 Variable exponent Lebesgue and Sobolev spaces

For the convenience of the reader, we recall in this section some results concerning spaces \( L^{p(x)}(\Omega) \) and \( W^{r,p(x)}(\Omega) \) which we call generalized Lebesgue-Sobolev spaces. Denote

\[
C_+ (\overline{\Omega}) = \{ p(x) : p(x) \in C (\overline{\Omega}), \ p(x) > 1, \ \text{for all} \ x \in \overline{\Omega} \}.
\]
For any \( p(x) \in C(\bar{\Omega}) \), we introduce the variable exponent Lebesgue space

\[
L^{p(x)}(\Omega) = \left\{ u(x) : u(x) \text{ is a measurable real-valued function such that } \int_{\Omega} |u(x)|^{p(x)} \, dx < \infty \right\},
\]

endowed with the so-called Luxemburg norm

\[
\|u\|_{L^{p(x)}(\Omega)} = |u|_{p(\cdot)} = \inf \left\{ \mu > 0; \int_{\Omega} \frac{|u(x)|^{p(x)}}{\mu} \, dx \leq 1 \right\},
\]

which is a separable and reflexive Banach space. A thorough variational analysis of the problems with variable exponents has been developed in the monograph by Rădulescu and Repovš [37] (we refer the reader also to [16, 28]).

**Proposition 2.1** (see [42]). The space \( (L^{p(x)}(\Omega), |\cdot|_{p(\cdot)}) \) is separable, uniformly convex, reflexive and its conjugate space is \( L^{q(x)}(\Omega), |\cdot|_{q(\cdot)} \) where \( q(x) \) is the conjugate function of \( p(x) \) i.e

\[
\frac{1}{p(x)} + \frac{1}{q(x)} = 1, \quad \text{for all } x \in \Omega.
\]

For all \( u \in L^{p(x)}(\Omega) \) and \( v \in L^{q(x)}(\Omega) \) the Hölder type inequality

\[
\left| \int_{\Omega} uv \, dx \right| \leq \left( \frac{1}{p} + \frac{1}{q} \right) |u|_{p(\cdot)}|v|_{q(\cdot)} \leq 2|u|_{p(\cdot)}|v|_{q(\cdot)}
\]

holds.

The inclusion between Lebesgue spaces also generalizes the classical framework, namely if \( 0 < \| \Omega \| < \infty \) and \( p_1, p_2 \) are variable exponents such that \( p_1 \leq p_2 \) in \( \Omega \), then there exists a continuous embedding \( L^{p_1(x)}(\Omega) \rightarrow L^{p_2(x)}(\Omega) \). An important role in manipulating the generalized Lebesgue-Sobolev spaces is played by the \( p(\cdot) \)-modular of the \( L^{p(x)}(\Omega) \) space, which is the modular \( \rho_{p(\cdot)} \) of the space \( L^{p(x)}(\Omega) \)

\[
\rho_{p(\cdot)}(u) := \int_{\Omega} |u|^{p(x)} \, dx.
\]

**Lemma 2.1.** If \( u_n, u \in L^{p(\cdot)} \) and \( p_+ < +\infty \), then the following properties hold:

1. \( |u|_{p(\cdot)} > 1 \Rightarrow |u|_{p(\cdot)}^p \leq \rho_{p(\cdot)}(u) \leq |u|_{p(\cdot)}^p \);  
2. \( |u|_{p(\cdot)} < 1 \Rightarrow |u|_{p(\cdot)}^p \leq \rho_{p(\cdot)}(u) \leq |u|_{p(\cdot)}^p \);  
3. \( |u|_{p(\cdot)} < 1 \) (respectively \( = 1; > 1 \)) \( \iff \rho_{p(\cdot)}(u) < 1 \) (respectively \( = 1; > 1 \));  
4. \( |u_n|_{p(\cdot)} \to 0 \) (respectively \( \to +\infty \)) \( \iff \rho_{p(\cdot)}(u_n) \to 0 \) (respectively \( \to +\infty \));  
5. \( \lim_{n \to \infty} |u_n - u|_{p(\cdot)} = 0 \iff \lim_{n \to \infty} \rho_{p(\cdot)}(u_n - u) = 0 \).

The Sobolev space with variable exponent \( W^{r,p(\cdot)}(\Omega) \) is defined as

\[
W^{r,p(\cdot)}(\Omega) := \left\{ u \in L^{p(\cdot)}(\Omega) : D^\alpha u \in L^{p(\cdot)}(\Omega), \ |\alpha| \leq r \right\},
\]

where \( D^\alpha u = \frac{\partial^{|\alpha|}}{\partial x_1^{\alpha_1} \partial x_2^{\alpha_2} \cdots \partial x_N^{\alpha_N}} u \), with \( \alpha = (\alpha_1, \ldots, \alpha_N) \) is a multi-index and \( |\alpha| = \sum_{i=1}^{N} \alpha_i \). The space \( W^{r,p(\cdot)}(\Omega) \) is a reflexive and separable Banach space if \( 1 < p_+ < +\infty \) and equipped with the norm

\[
\|u\|_{r,p(\cdot)} := \sum_{|\alpha| \leq r} |D^\alpha u|_{p(\cdot)}.
\]
Lemma 3.1. Assume that \( W_0^{r,p} (\Omega) \) denote the completion of \( C_0^\infty (\Omega) \) in \( W^{r,p} (\Omega) \). As shown in ([16], Corollary 11.2.4), the space \( W_0^{r,p} (\Omega) \) coincides with the closure in \( W^{r,p} (\Omega) \) of the set of all \( W^{r,p} (\Omega) \)-functions with compact support.

Proposition 2.2 (see [20]). Assume that \( s \in C (\bar{\Omega}) \) satisfies \( s(x) \leq 2^*(x) \) for all \( x \in \bar{\Omega} \). Then there is a continuous embedding \( X \to L^{\gamma (x)} (\Omega) \). If we replace \( s \) with \( \triangle \), then this embedding is compact.

In the light of the variational structure of (1.1), we look for critical points of the associated Euler-Lagrange functional \( J : X \to \mathbb{R} \) defined as

\[
J(u) = a \int_\Omega \frac{\nabla^2 u}{p(x)} dx - \frac{b}{\gamma + 1} \left( \int_\Omega \frac{\nabla^2 u}{p(x)} dx \right)^{\gamma + 1} - \lambda \int_\Omega f(x) |u|^{q(x)} dx - \int_\Omega g \cdot u = 0 \quad (2.1)
\]

Note that \( J \) is a \( C^1 (X, \mathbb{R}) \) functional and

\[
\langle J'(u), v \rangle = \left[ a - b \left( \int_\Omega \frac{\nabla^2 u}{p(x)} dx \right)^{\gamma} \right] \int_\Omega \nabla u \nabla v dx + \lambda \int_\Omega f(x) |u|^{q(x)-2} u v dx - \int_\Omega g \cdot \nabla u = 0 \quad (2.2)
\]

for any \( v \in X \). Thus, critical points of \( J \) are weak solutions of (1.1).

3 Some Lemmas

In order to prove our main result - Theorem 1.1 - we need to apply the Mountain pass theorem and the Ekeland variational principle. We first prove the following lemmas.

Lemma 3.1. Assume that \( f \) satisfies (H1) - (H2). Then there exist \( \bar{\lambda}, \delta, \rho, \alpha > 0 \) such that for \( \lambda \in (0, \bar{\lambda}) \) and \( |h|_{\gamma 1 (x)} < \delta \), we have \( J(u) \geq \alpha \) for all \( u \in X \) with \( \|u\|_X = \rho \). Moreover, there exists \( e \in X \) with \( \|e\|_X > \rho \), such that \( J(e) < 0 \).

Proof. Step 1. From (H1) and (H2), we can note that \( f \in L^q (\Omega, \Omega) \), \( g \in L^{r(x)} (\Omega) \) imply \( f \in L^q (\Omega) \), \( g \in L^{r(x)} (\Omega) \). Then by Proposition 2.2, there exist constants \( C_1, C_2 > 0 \) such that

\[
\int_\Omega |f(x)||u|^{q(x)} dx \leq 2 |f|_{q (x)} \left| u \right|^{q(x)}_{C_{q(x)}} \leq C_1 |f|_{q (x)} \max \left\{ \|u\|_{X}^q, \|u\|_{X}^q \right\}, \quad (3.1)
\]

\[
\int_\Omega |g(x)||u|^{r(x)} dx \leq 2 |g|_{r (x)} \left| u \right|^{r(x)}_{C_{r(x)}} \leq C_2 |g|_{r (x)} \max \left\{ \|u\|_{X}^r, \|u\|_{X}^r \right\} \quad (3.2)
\]

and by Young’s inequality,

\[
\int_\Omega |h(x)||u| dx \leq 2 |h|_{p(x)} \left| u \right|_{p(x)} \]
\[
\begin{align*}
J(u) &= a \int_\Omega \frac{\nabla \Delta u}{p(x)} dx - \frac{b}{\gamma + 1} \left( \int_\Omega \frac{\nabla \Delta u}{p(x)} dx \right)^{\gamma+1} - \lambda \int_\Omega \frac{f(x)}{q(x)} |u|^q(x) dx \\
&\quad - \int_\Omega \frac{g(x)}{r(x)} |u|^r(x) dx - \int h(x) u dx \\
&\geq \frac{a}{p^+} \|u\|_{p^+}^{p^+} - b \left( \frac{b}{(p^-)^{\gamma+1}(\gamma + 1)} \right) \|u\|_{X}^{p^+(\gamma+1)} - C_1 |f|_{q_0} \|u\|_{X}^{q_0} - C_2 |g|_{r_0} \|u\|_{X}^{r_0} \\
&\quad - C_3 C_\varepsilon |h|_{p^-}^{p^-} - C_3 C_\varepsilon |h|_{p^-}^{p^-}.
\end{align*}
\]

Choosing \( \varepsilon = \frac{a}{2p^-C_3} \), this leads to

\[
J(u) \geq \frac{a}{2p^+} \|u\|_{p^+}^{p^+} - b \left( \frac{b}{(p^-)^{\gamma+1}(\gamma + 1)} \right) \|u\|_{X}^{p^+(\gamma+1)} - C_1 |f|_{q_0} \|u\|_{X}^{q_0} - C_2 |g|_{r_0} \|u\|_{X}^{r_0} \\
- C_3 C_\varepsilon |h|_{p^-}^{p^-}.
\]

Since \( p^+ < p_- \) and \( p_- < r_- \), we can choose \( \rho > 0 \) sufficiently small so that the following holds

\[
C_\rho = \frac{a}{2p^+} - \left( \frac{b}{(p^-)^{\gamma+1}(\gamma + 1)} \right) \rho^{p^+(\gamma+1)-p_-} - C_2 \left( \frac{b}{r_-} \right) \rho^{r_- - p_-} > 0.
\]

Hence, let us choose \( \lambda = \frac{C_\rho q_0}{2C_1 |f|_{q_0} \rho^{q_0 - p_-}} > 0 \) and \( \delta = \frac{1}{2} \left( \frac{C_\rho \rho^{p^+}}{2C_3 C_\varepsilon} \right)^{\frac{1}{p^-}} > 0 \). It follows that for each \( \lambda \in (0, \overline{\lambda}) \) and \( |h|_{p^-}^{\frac{1}{p^-}} < \delta \), we have

\[
J(u) \geq \frac{1}{4} C_\rho \rho^{p^+} = a > 0.
\]

**Step 2.** Let \( \phi_0 \in C_0^\infty(\Omega_0) \), where \( \Omega_0 \subset \{ x \in \Omega : g(x) > 0 \} \). According to the conditions \((H_1)\) and \((H_2)\), for \( t > 1 \) large enough we have

\[
J(t\phi_0) = a \int_\Omega \frac{\nabla \Delta \phi_0}{p(x)} dx - \frac{b}{\gamma + 1} \left( \int_\Omega \frac{\nabla \Delta \phi_0}{p(x)} dx \right)^{\gamma+1} - \lambda \int_\Omega \frac{f(x)}{q(x)} |\phi_0|^q(x) dx \\
- \int_\Omega \frac{g(x)}{r(x)} |t\phi_0|^r(x) dx - \int h(x) t\phi_0 dx \\
\leq a \rho^{p^+} \int_\Omega \frac{\nabla \Delta \phi_0}{p(x)} dx - \frac{b \rho^{p^+} (\gamma+1)}{\gamma + 1} \left( \int_\Omega \frac{\nabla \Delta \phi_0}{p(x)} dx \right)^{\gamma+1} + \lambda \rho^{q_0} \rho^{q_0 - p_-} \int_\Omega \frac{f(x)}{q(x)} |\phi_0|^q(x) dx \\
\]
\[
- \frac{t^r}{\gamma} \int_{\Omega} g(x)|\phi_0|^{r(x)} \, dx - t \int_{\Omega} h(x) \phi_0 \, dx.
\]

Since \(1 < q_* < p_* < p_-(\gamma + 1) < r_\ast\), we have \(J(t\phi_0) \to -\infty\) as \(t \to \infty\). So, for some \(t_0 > 1\) large enough, we deduce that \(\|t_0\phi_0\|_X > \rho\) and \(J(t_0\phi_0) < 0\). Choosing \(e = t_0\phi_0\), the proof of Lemma 3.1 is completed. \(\square\)

**Lemma 3.2.** Assume that \(f\) satisfies (H1) – (H2). Then the functional \(J\) satisfies the Palais-Smale condition at level \(c\) (popularly called \((PS)_c\) condition), where \(c < \frac{\gamma a^{\gamma + 1}}{(\gamma + 1)b^{\gamma + 1}}\).

**Proof.** Let \(\{u_n\}\) be a \((PS)_c\) sequence of \(J\) such that \(c < \frac{\gamma a^{\gamma + 1}}{(\gamma + 1)b^{\gamma + 1}}\), that is

\[
J(u_n) \to c, \quad J'(u_n) \to 0 \quad \text{in} \quad X^*, \quad n \to \infty,
\]

where \(X^*\) is the dual space of \(X\).

**Step 1.** We first prove that \(\{u_n\}\) is bounded in \(X\). Arguing by contradiction, if \(\{u_n\}\) is unbounded in \(X\), up to a subsequence, we may assume that \(\|u_n\|_X \to \infty\) as \(n \to \infty\). Let \(\theta\) be a fixed positive constant such that

\[
\theta \in \left(p_+, \min \left\{r_\ast, \frac{(p_\ast)^{\gamma + 1}(\gamma + 1)}{(p_\ast)^{\gamma}} \right\} \right).
\]

Then according to the conditions (H1) and (H2), for \(n\) large enough, we have

\[
c + 1 + \|u_n\|_X \geq J(u_n) - \frac{1}{\theta} J'(u_n), u_n)\]

\[
= a \int_{\Omega} \left( \frac{1}{p(x)} - \frac{1}{\theta} \right) |\nabla u_n|^{p(x)} \, dx - b \left( \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{p(x)} \, dx \right)^{\gamma + 1} \]

\[
+ \frac{b}{\theta} \left( \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{p(x)} \, dx \right)^{\gamma} \int_{\Omega} |\nabla u_n|^{p(x)} \, dx + \lambda \int_{\Omega} \left( \frac{1}{\theta} - \frac{1}{q(x)} \right) f(x)u_n|^{q(x)} \, dx
\]

\[
+ \int_{\Omega} \left( \frac{1}{\theta} - \frac{1}{r(x)} \right) g(x)|u_n|^{r(x)} \, dx + \left( \frac{1}{\theta} - 1 \right) \int_{\Omega} h(x)u_n \, dx
\]

\[
\geq a \left( \frac{1}{p_+} - \frac{1}{\theta} \right) \|u_n\|^{p_+} + b \left( \frac{1}{\theta p_\ast} - \frac{1}{p_\ast} \right) \|u_n\|^{p_\ast} + \lambda C_1 \left( \frac{1}{q_*} - \frac{1}{\theta} \right) \|f|_{q_\ast} \|u_n\|^{q_*} - C_3 \left( 1 - \frac{1}{\theta} \right) \|h|_{p_\ast} \|u_n\|^{\gamma + 1} \|u_n\|_X.
\]

From (3.5), it follows that

\[
c + 1 + \left[ 1 + C_3 \left( 1 - \frac{1}{\theta} \right) \|h|_{p_\ast}^{\gamma + 1} \right] \|u_n\|_X + \lambda C_1 \left( \frac{1}{q_*} - \frac{1}{\theta} \right) \|f|_{q_\ast} \|u_n\|^{q_*} \geq a \left( \frac{1}{p_+} - \frac{1}{\theta} \right) \|u_n\|^{p_+}
\]

\[
+ b \left( \frac{1}{\theta p_\ast} - \frac{1}{p_\ast} \right) \|u_n\|^{\gamma + 1} \||u_n\|_X
\]

which is a contradiction since \(\|u_n\|_X \to \infty\) as \(n \to \infty\). So, \(\{u_n\}\) is bounded in \(X\) and the first assertion is proved.

**Step 2.** Now, we prove that \(\{u_n\}\) has a convergent subsequence in \(X\). Indeed, by Proposition 2.2, the embedding \(X \to L^{s(\cdot)}(\Omega)\) is compact, where \(1 \leq s(x) < p(x)^\ast\). Since \(X\) is a reflexive Banach space, passing if necessary, to a subsequence, there exists \(u \in X\) such that

\[
u_n \to u \text{ in } X, \quad u_n \to u \text{ in } L^{s(\cdot)}(\Omega), \quad u_n(\cdot) \to u(\cdot), \quad \text{a.e. in } \Omega.
\]
From (2.2), we find that
\[
\langle f'(u_n), u_n - u \rangle = a - b \left( \int_\Omega \left| \nabla \Delta u_n \right|^{p(x)} \frac{dx}{p(x)} \right)^\gamma \int_\Omega \left| \nabla \Delta u_n \right|^{p(x)-2} \nabla \Delta u_n (\nabla \Delta u_n - \nabla u) \right) dx 
- \lambda \int_\Omega f(x)|u_n|^{q(x)-2} u_n (u_n - u) \right) dx - \int_\Omega g(x)|u_n|^{r(x)-2} u_n (u_n - u) \right) dx 
- \int_\Omega h(x)(u_n - u) \right) dx. 
\tag{3.7}
\]

Meanwhile, by Hölder's inequality and (3.6) we estimate
\[
\left| \int_\Omega f(x)|u_n|^{q(x)-2} u_n (u_n - u) \right) dx \leq \int_\Omega |f(x)||u_n|^{q(x)-1} |u_n - u| \right) dx 
\leq |f|_{q_0(x)+\eta} \left| u_n \right|^{q(x)-1} \left| \right|_{\rho(x)} |u_n - u|_{\theta(x)} 
\leq \max \left\{ \left| u \right|^{q-1}, \left| u \right|^{q-1} \int \int |f|_{q_0(x)+\eta} |u_n - u|_{\theta_1(x)} \right) \right. 
\tag{3.8}
\]

where \( \theta_1 \in C(\overline{\Omega}) \) such that
\[
\frac{1}{q_0(x)+\eta} + \frac{q(x)-1}{p^*(x)} + \frac{1}{\theta_1(x)} = 1.
\]

We can easily verify that
\[
\theta_1(x) := \frac{p^*(x)(p^*(x) + \eta p^*(x) - q(x)\eta)}{\eta p^*(x)^2 + (-2q(x)\eta + \eta + 1)p^*(x) + q(x)\eta(q(x) - 1)} < p^*(x).
\]

So, thanks to (3.6) we can deduce that
\[
|u_n - u|_{\theta_1(x)} \to 0 \text{ as } n \to \infty. 
\tag{3.9}
\]

Combining this and the fact that \( \{u_n\} \) is bounded in \( X \), we infer from (3.8) and (3.9) that
\[
\lim_{n \to \infty} \int_\Omega f(x)|u_n|^{q(x)-2} u_n (u_n - u) \right) dx = 0. 
\tag{3.10}
\]

Similarly, we obtain
\[
\lim_{n \to \infty} \int_\Omega g(x)|u_n|^{r(x)-2} u_n (u_n - u) \right) dx = 0 \text{ and } \lim_{n \to \infty} \int_\Omega h(x)(u_n - u) \right) dx = 0. 
\tag{3.11}
\]

By (3.4), we have
\[
\langle f'(u_n), u_n - u \rangle \to 0.
\]

So, from (3.10) and (3.11), we can deduce that (3.7) implies
\[
\left[ a - b \left( \int_\Omega \left| \nabla \Delta u_n \right|^{p(x)} \frac{dx}{p(x)} \right)^\gamma \right] \int_\Omega \left| \nabla \Delta u_n \right|^{p(x)-2} \nabla \Delta u_n (\nabla \Delta u_n - \nabla u) \right) dx \to 0. 
\tag{3.12}
\]

Since \( \{u_n\} \) is bounded in \( X \), passing to a subsequence, if necessary, we may assume that when \( n \to \infty \) then
\[
\int_\Omega \left| \nabla \Delta u_n \right|^{p(x)} \frac{dx}{p(x)} \right) dx \to t_0 \geq 0.
\]

If \( t_0 = 0 \) then \( \{u_n\} \) converges strongly to \( u = 0 \) in \( X \) and the proof is finished. Otherwise, we need to consider the following two cases:
Case 1. If \( t_0 \neq \left( \frac{a}{b} \right)^{\frac{1}{r}} \) then \( a - b \left( \int_{\Omega} \left| \nabla u_n \right|^{p(x)} dx \right)^{\frac{1}{r}} \to 0 \) is not true and no subsequence of

\[
\{ a - b \left( \int_{\Omega} \left| \nabla u_n \right|^{p(x)} dx \right)^{\frac{1}{r}} \to 0 \}
\]

converges to zero. Therefore, there exists \( \delta > 0 \) such that

\[
\left| a - b \left( \int_{\Omega} \left| \nabla u_n \right|^{p(x)} dx \right)^{\frac{1}{r}} \right| > \delta > 0 \text{ when } n \text{ is large enough. So, it is clear that}
\]

\[
\left\{ a - b \left( \int_{\Omega} \left| \nabla u_n \right|^{p(x)} dx \right)^{\frac{1}{r}} \to 0 \right\}
\]

is bounded. \hspace{1cm} (3.13)

Case 2. If \( t_0 = \left( \frac{a}{b} \right)^{\frac{1}{r}} \) then \( a - b \left( \int_{\Omega} \left| \nabla u_n \right|^{p(x)} dx \right)^{\frac{1}{r}} \to 0 \).

We define

\[
\varphi(u) = \lambda \int_{\Omega} f(x)\left| \frac{|u|^{q(x)}}{q(x)} \right| dx + \int_{\Omega} g(x)\left| \frac{|u|^{r(x)}}{r(x)} \right| dx + \int_{\Omega} h(x)u \, dx, \text{ for all } u \in X.
\]

Then

\[
\langle \varphi'(u), v \rangle = \lambda \int_{\Omega} f(x)|u|^{q(x)-2}uv \, dx + \int_{\Omega} g(x)|u|^{r(x)-2}uv \, dx + \int_{\Omega} h(x)v \, dx, \text{ for all } v \in X.
\]

It follows that

\[
\langle \varphi'(u_n) - \varphi'(u), v \rangle = \lambda \int_{\Omega} f(x)|u_n|^{q(x)-2}u_n - |u|^{q(x)-2}u)v \, dx + \int_{\Omega} g(x)|u_n|^{r(x)-2}u_n - |u|^{r(x)-2}u)v \, dx.
\]

To complete the argument we need the following lemma.

**Lemma 3.3.** Let \( u_n, u \in X \) be such that (3.6) holds. Then passing to a subsequence if necessary, the following properties hold:

(i) \( \lim_{n \to \infty} \int_{\Omega} f(x)|u_n|^{q(x)-2}u_n - |u|^{q(x)-2}u \, dx = 0; \)

(ii) \( \lim_{n \to \infty} \int_{\Omega} g(x)|u_n|^{r(x)-2}u_n - |u|^{r(x)-2}u \, dx = 0; \)

(iii) \( \langle \varphi'(u_n), \varphi'(u) \rangle \to 0, \text{ } v \in X. \)

**Proof.** Let \( \theta_2 \in C(\Omega) \) be such that \( \theta_2(x) < \frac{q(x) - 1}{q(x)} p^*(x) \). From (3.6), we deduce that \( u_n \rightarrow u \) in \( L^{\theta_2(x)}(\Omega) \) which implies that

\[
\left| u_n|^{q(x)-2}u_n - |u|^{q(x)-2}u \right|_{\theta_2(x)} \rightarrow 0 \text{ as } n \rightarrow \infty.
\]

Now, we define

\[
q_0(x) = \frac{p^*(x)}{p^*(x) - q(x)}, \quad l_1(x) = \frac{\theta_2(x)}{q(x) - 1}, \quad l_2(x) = \frac{p^*(x)\theta_2(x)}{q(x)\theta_2(x) - p^*(x)q(x) + p^*(x)},
\]

where

\[
l_2(x) < p^*(x), \text{ and } \frac{1}{q_0(x)} + \frac{1}{l_1(x)} + \frac{1}{l_2(x)} = 1.
\]

So, thanks to Hölder’s inequality we can deduce that

\[
\int_{\Omega} \left| f(x)|u_n|^{q(x)-2}u_n - f(x)|u|^{q(x)-2}u \right| v \, dx \leq \int_{\Omega} |f(x)|\left| u_n|^{q(x)-2}u_n - |u|^{q(x)-2}u \right| |v| \, dx
\]
This is a contradiction since

Hence, we can deduce that

We can now complete the proof of Case 2. By Lemma 3.3 and since

By the fundamental lemma of the variational method (see [41]) it follows that

Finally, assertion (iii) follows by combining parts (i) and (ii). Consequently, \( \|\varphi'(u_n) - \varphi'(u)\|_{X'} \to 0 \) and \( \varphi'(u_n) \to \varphi'(u) \).

We can now complete the proof of the case. By Lemma 3.3 and since

and therefore

By the fundamental lemma of the variational method (see [41]) it follows that \( u = 0 \). Thus

Hence, we can deduce that

This is a contradiction since \( f(u_n) \to c < \frac{\gamma a^{\frac{\gamma+1}{\gamma}}}{(\gamma+1)b^\frac{\gamma+1}{\gamma}} \), hence

is not true and similarly to Case 1, we have that

So, it follows from the two cases above that

\[
\int_{\Omega} |\nabla \Delta u_n|^{p(x)-2} \nabla \Delta u_n (\nabla \Delta u_n - \nabla u) \, dx \to 0.
\]
Applying \((S_\lambda)\) mapping theory (see [14] for \(r = 3\)), we can now deduce that \(\|u_n\|_X \rightarrow \|u\|_X\) as \(n \rightarrow \infty\), which means that \(f\) satisfies the \((PS)_c\) condition. This completes the proof.

\[\tag{Remark 3.1} \text{The \((PS)_c\) condition is not satisfied for } c > \frac{\gamma a^{\frac{\gamma+1}{\gamma}}}{(\gamma + 1)b^{\frac{1}{\gamma}}}. \]

Indeed,

\[
J(u) = a \int_{\Omega} \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx - b \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx \left( \int_{\Omega} \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx \right)^{\gamma+1} - \lambda \int_{\Omega} f(x) |u|^{q(x)} dx 
- \frac{g(x)}{r(x)} |u|^{r(x)} dx - \int_{\Omega} h(x)u dx
\]

\[
\leq a \int_{\Omega} \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx - b \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx \left( \int_{\Omega} \frac{\nabla \Delta u |^{p(x)}{p(x)}}{p(x)} dx \right)^{\gamma+1} \leq \frac{\gamma a^{\frac{\gamma+1}{\gamma}}}{(\gamma + 1)b^{\frac{1}{\gamma}}},
\]

So, if \(\{u_n\}\) is a \((PS)_c\) sequence of \(J\), then we have \(c \leq \frac{\gamma a^{\frac{\gamma+1}{\gamma}}}{(\gamma + 1)b^{\frac{1}{\gamma}}}\), which is a contradiction.

4 Proof of Theorem 1.1

In view of Lemmas 3.1, 3.2 and the Mountain pass theorem in [41], there exists a weak solution \(u_1\) of problem (1.1) with \(\tilde{c} = J(u_1) > 0\). We will show that there exists a second weak solution \(u_2 \neq u_1\) by using the Ekeland variational principle. First, let us choose \(\psi_0 \in C^\infty_0(\Omega)\) such that \(\int_{\Omega} h(x)\psi_0 dx > 0\). Now, for all \(t \in (0, 1)\) small enough, we have

\[
\begin{align*}
J(t\psi_0) &= a \int_{\Omega} \frac{\nabla \Delta t\psi_0 |^{p(x)}{p(x)}}{p(x)} dx - b \frac{\nabla \Delta t\psi_0 |^{p(x)}{p(x)}}{p(x)} dx \left( \int_{\Omega} \frac{\nabla \Delta t\psi_0 |^{p(x)}{p(x)}}{p(x)} dx \right)^{\gamma+1} - \lambda \int_{\Omega} f(x) |t\psi_0|^{q(x)} dx \\
&\quad - \frac{g(x)}{r(x)} |t\psi_0|^{r(x)} dx - \int_{\Omega} h(x)t\psi_0 dx \\
&\leq at^{p_-} \int_{\Omega} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx - b t^{p_-(\gamma+1)} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx \left( \int_{\Omega} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx \right)^{\gamma+1} \\
&\quad + \frac{\lambda t q_-}{q_-} \int_{\Omega} f(x) |\psi_0|^{q(x)} dx \\
&\quad + t^r_- \int_{\Omega} g(x) |\psi_0|^{r(x)} dx - t \int_{\Omega} h(x)\psi_0 dx < 0 \tag{4.1}
\end{align*}
\]

since

\[
\begin{align*}
at^{p_-} \int_{\Omega} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx + \frac{\lambda t q_-}{q_-} \int_{\Omega} f(x) |\psi_0|^{q(x)} dx - t \int_{\Omega} h(x)\psi_0 dx < 0, & \quad 1 < q_- < p_- \\
\text{and}
\end{align*}
\]

\[
\begin{align*}
t^r_- \int_{\Omega} g(x) |\psi_0|^{r(x)} dx - b t^{p_-(\gamma+1)} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx \left( \int_{\Omega} \frac{\nabla \Delta \psi_0 |^{p(x)}{p(x)}}{p(x)} dx \right)^{\gamma+1} < 0, & \quad p_- \gamma + 1 < r_- 
\end{align*}
\]

for all \(t \in (0, 1)\) small enough.

By Lemma 3.1, it follows that on the boundary of the ball centered at the origin and of radius \(\rho\) in \(X\), denoted by \(B_\rho(0)\), we have

\[
\inf_{u \in \partial B_\rho(0)} J(u) > 0.
\]
On the other hand, again by Lemma 3.1, the functional $J$ is bounded from below on $B_ρ(0)$. Moreover, by (3.4), there exists $ψ_0 ∈ X$ such that $J(tψ_0) < 0$ for all $t > 0$ small enough. It follows that

$$-∞ < c = \inf_{u ∈ B_ρ(0)} J(u) < 0.$$  

Let us choose $ε > 0$ such that $0 < ε < \inf_{u ∈ B_ρ(0)} J(u) - \inf_{u ∈ B_ρ(0)} J(u)$. Applying Ekeland’s variational principle [17] to the functional $J : B_ρ(0) → R$, it follows that there exists $u_ε ∈ B_ρ(0)$ such that

$$J(u_ε) < \inf_{u ∈ B_ρ(0)} J(u) + ε,$$

$$J(u_ε) < J(u) + ε \parallel u - u_ε \parallel_X, \quad u ≠ u_ε,$$

so we have $J(u_ε) < \inf_{u ∈ B_ρ(0)} J(u)$ and thus, $u_ε ∈ B_ρ(0)$.

Now, we define the functional $I : B_ρ(0) → R$ by $I(u) = J(u) + ε \parallel u - u_ε \parallel_X$. It is clear that $u_ε$ is a minimum point of $I$ and thus

$$\frac{I(u_ε + τv) - I(u_ε)}{τ} ≥ 0$$

for all $τ > 0$ small enough and all $v ∈ B_ρ(0)$. The above information shows that

$$\frac{J(u_ε + τv) - J(u_ε)}{τ} + ε \parallel v \parallel_X ≥ 0.$$

Letting $τ → 0^+$, we deduce that

$$\langle J'(u_ε), v \rangle + ε \parallel v \parallel_X ≥ 0,$$

which leads to $\parallel J'(u_ε) \parallel_X ≤ ε$. Therefore, there exists a sequence $\{u_n\} ⊂ B_ρ(0)$ such that

$$J(u_n) → c = \inf_{u ∈ B_ρ(0)} J(u) < 0 \text{ and } J'(u_n) → 0 \text{ in } X^* \text{ as } n → \infty.$$  \hfill (4.2)

By Lemma 3.2, the sequence $\{u_n\}$ converges strongly to some $u_2$ as $n → \infty$. Moreover, since $J ∈ C^1(X, R)$, by (4.2) it follows that $J'(u_2) = 0$. Thus, $u_2$ is a nontrivial weak solution of problem (1.1) with negative energy $J(u_2) = c < 0$.

Finally, we point out the fact that $u_1 ≠ u_2$ since $J(u_1) = τ > 0 > c = J(u_2)$. The proof of Theorem 1.1 is now complete.

**Remark 4.1.** The proof of Theorem 1.2 is very similar.
