FIGURES

1. Total number of scientific journals and abstract journals founded, as a function of date 9
2. Cumulative number of abstracts in various scientific fields, from the beginning of the abstract service to given date 10
3. Growth of scientific manpower and of general population in the United States 12
4. Total number of physics abstracts published since January 1, 1900 18
5. General form of the logistic curve 21
6. Growth in length of a beanstalk as a function of age 22
7. Ways in which logistic growth may react to ceiling conditions 24
8. Logistic growth of raw material production, showing oscillation on attaining ceiling conditions 26
9. Number of universities founded in Europe 27
10. The rate of increase of operating energy in particle accelerators 28
11. Number of chemical elements known as a function of date 29
12. Lotka's law 42
13. Number of authors publishing at least $n$ papers as a function of $n$ 44
14. Numbers of publications of four series of highly dis-
FIGURES XV

tinguished and (incidentally) highly prolific authors, each ranked within the series 47
15. United States, 1790–1930 58
16. Number of scientific periodicals published by each country, ranked in decreasing order of such numbers 60
17. Utilization of journals (i.e., number of times consulted in a given year), ranked in decreasing order of utilization 76
18. The half-life of scientific literature 80
19. Incidence of multiple authorship as a function of date 88
20. Percentages of world total of output of papers in Chemical Abstracts, by countries, 1910–60 96
21. Number of trained physicists in Japan as a function of date 99
How big are you, baby?
Why, don't you know,
You're only so big,
And there's still room to grow.

(NURSERY RHYME)
