**Summary.** In this article we prove Cauchy-Riemann differential equations of complex functions. These theorems give necessary and sufficient condition for differentiable function.

MML identifier: CFDIFF\_2, version: 7.11.02 4.125.1059

The articles [20], [21], [6], [7], [22], [8], [3], [1], [4], [14], [13], [19], [16], [9], [2], [5], [10], [17], [11], [18], [12], and [15] provide the notation and terminology for this paper.

Let  $f$  be a partial function from  $\mathbb{C}$  to  $\mathbb{C}$ . The functor  $\mathfrak{R}(f)$  yielding a partial function from  $\mathbb{C}$  to  $\mathbb{R}$  is defined as follows:

(Def. 1)  $\text{dom } f = \text{dom } \mathfrak{R}(f)$  and for every complex number  $z$  such that  $z \in \text{dom } \mathfrak{R}(f)$  holds  $\mathfrak{R}(f)(z) = \Re(f_z)$ .

Let  $f$  be a partial function from  $\mathbb{C}$  to  $\mathbb{C}$ . The functor  $\mathfrak{S}(f)$  yields a partial function from  $\mathbb{C}$  to  $\mathbb{R}$  and is defined as follows:

(Def. 2)  $\text{dom } f = \text{dom } \mathfrak{S}(f)$  and for every complex number  $z$  such that  $z \in \text{dom } \mathfrak{S}(f)$  holds  $\mathfrak{S}(f)(z) = \Im(f_z)$ .

One can prove the following propositions:

- (1) For every partial function  $f$  from  $\mathbb{C}$  to  $\mathbb{C}$  such that  $f$  is total holds  $\text{dom } \mathfrak{R}(f) = \mathbb{C}$  and  $\text{dom } \mathfrak{S}(f) = \mathbb{C}$ .

- (2) Let  $f$  be a partial function from  $\mathbb{C}$  to  $\mathbb{C}$ ,  $u, v$  be partial functions from  $\mathcal{R}^2$  to  $\mathbb{R}$ ,  $z_0$  be a complex number,  $x_0, y_0$  be real numbers, and  $x_1$  be an element of  $\mathcal{R}^2$ . Suppose that
- (i) for all real numbers  $x, y$  such that  $x + y \cdot i \in \text{dom } f$  holds  $\langle x, y \rangle \in \text{dom } u$  and  $u(\langle x, y \rangle) = \Re(f)(x + y \cdot i)$ ,
  - (ii) for all real numbers  $x, y$  such that  $x + y \cdot i \in \text{dom } f$  holds  $\langle x, y \rangle \in \text{dom } v$  and  $v(\langle x, y \rangle) = \Im(f)(x + y \cdot i)$ ,
  - (iii)  $z_0 = x_0 + y_0 \cdot i$ ,
  - (iv)  $x_1 = \langle x_0, y_0 \rangle$ , and
  - (v)  $f$  is differentiable in  $z_0$ .

Then

- (vi)  $u$  is partially differentiable in  $x_1$  w.r.t. coordinate 1 and partially differentiable in  $x_1$  w.r.t. coordinate 2,
  - (vii)  $v$  is partially differentiable in  $x_1$  w.r.t. coordinate 1 and partially differentiable in  $x_1$  w.r.t. coordinate 2,
  - (viii)  $\Re(f'(z_0)) = \text{partdiff}(u, x_1, 1)$ ,
  - (ix)  $\Re(f'(z_0)) = \text{partdiff}(v, x_1, 2)$ ,
  - (x)  $\Im(f'(z_0)) = -\text{partdiff}(u, x_1, 2)$ , and
  - (xi)  $\Im(f'(z_0)) = \text{partdiff}(v, x_1, 1)$ .
- (3) For every sequence  $s$  of real numbers holds  $s$  is convergent and  $\lim s = 0$  iff  $|s|$  is convergent and  $\lim |s| = 0$ .
- (4) Let  $X$  be a real normed space and  $s$  be a sequence of  $X$ . Then  $s$  is convergent and  $\lim s = 0_X$  if and only if  $\|s\|$  is convergent and  $\lim \|s\| = 0$ .
- (5) Let  $u$  be a partial function from  $\mathcal{R}^2$  to  $\mathbb{R}$ ,  $x_0, y_0$  be real numbers, and  $x_1$  be an element of  $\mathcal{R}^2$ . Suppose  $x_1 = \langle x_0, y_0 \rangle$  and  $\langle u \rangle$  is differentiable in  $x_1$ . Then
- (i)  $u$  is partially differentiable in  $x_1$  w.r.t. coordinate 1 and partially differentiable in  $x_1$  w.r.t. coordinate 2,
  - (ii)  $\langle \text{partdiff}(u, x_1, 1) \rangle = \langle u \rangle'(x_1)(\langle 1, 0 \rangle)$ , and
  - (iii)  $\langle \text{partdiff}(u, x_1, 2) \rangle = \langle u \rangle'(x_1)(\langle 0, 1 \rangle)$ .

- (6) Let  $f$  be a partial function from  $\mathbb{C}$  to  $\mathbb{C}$ ,  $u, v$  be partial functions from  $\mathcal{R}^2$  to  $\mathbb{R}$ ,  $z_0$  be a complex number,  $x_0, y_0$  be real numbers, and  $x_1$  be an element of  $\mathcal{R}^2$ . Suppose that for all real numbers  $x, y$  such that  $\langle x, y \rangle \in \text{dom } v$  holds  $x + y \cdot i \in \text{dom } f$  and for all real numbers  $x, y$  such that  $x + y \cdot i \in \text{dom } f$  holds  $\langle x, y \rangle \in \text{dom } u$  and  $u(\langle x, y \rangle) = \Re(f)(x + y \cdot i)$  and for all real numbers  $x, y$  such that  $x + y \cdot i \in \text{dom } f$  holds  $\langle x, y \rangle \in \text{dom } v$  and  $v(\langle x, y \rangle) = \Im(f)(x + y \cdot i)$  and  $z_0 = x_0 + y_0 \cdot i$  and  $x_1 = \langle x_0, y_0 \rangle$  and  $\langle u \rangle$  is differentiable in  $x_1$  and  $\langle v \rangle$  is differentiable in  $x_1$  and  $\text{partdiff}(u, x_1, 1) = \text{partdiff}(v, x_1, 2)$  and  $\text{partdiff}(u, x_1, 2) = -\text{partdiff}(v, x_1, 1)$ . Then  $f$  is differentiable in  $z_0$  and  $u$  is partially differentiable in  $x_1$  w.r.t. coordinate 1 and partially differentiable in  $x_1$  w.r.t. coordinate 2 and  $v$  is partially differentiable in

$x_1$  w.r.t. coordinate 1 and partially differentiable in  $x_1$  w.r.t. coordinate 2 and  $\Re(f'(z_0)) = \text{partdiff}(u, x_1, 1)$  and  $\Re(f'(z_0)) = \text{partdiff}(v, x_1, 2)$  and  $\Im(f'(z_0)) = -\text{partdiff}(u, x_1, 2)$  and  $\Im(f'(z_0)) = \text{partdiff}(v, x_1, 1)$ .
