Summary. This article describes definitions of subsymmetric matrix, anti-subsymmetric matrix, central symmetric matrix, symmetry circulant matrix and their basic properties.

MML identifier: MATRIX17, version: 7.12.02 4.174.1136

The notation and terminology used here have been introduced in the following papers: [7], [9], [13], [6], [14], [1], [3], [18], [17], [4], [2], [8], [11], [12], [16], [15], [5], and [10].

1. BASIC PROPERTIES OF SUBORDINATE SYMMETRIC MATRICES

For simplicity, we use the following convention: n denotes a natural number, K denotes a field, a, b denote elements of K , p, q denote finite sequences of elements of K , and M_1, M_2 denote square matrices over K of dimension n .

Let K be a field, let n be a natural number, and let M be a square matrix over K of dimension n . We say that M is subsymmetric if and only if:

(Def. 1) For all natural numbers i, j, k, l such that $\langle i, j \rangle \in$ the indices of M and $k = (n + 1) - j$ and $l = (n + 1) - i$ holds $M_{i,j} = M_{k,l}$.

Let us consider n, K, a . Note that $(a)^{n \times n}$ is subsymmetric.

Let us consider n, K . Observe that there exists a square matrix over K of dimension n which is subsymmetric.

¹Authors thanks Andrzej Trybulec and Yatsuka Nakamura for the help during writing this article.

Let us consider n, K and let M be a subsymmetric square matrix over K of dimension n . Note that $-M$ is subsymmetric.

Let us consider n, K and let M_1, M_2 be subsymmetric square matrices over K of dimension n . One can check that $M_1 + M_2$ is subsymmetric.

Let us consider n, K, a and let M be a subsymmetric square matrix over K of dimension n . Note that $a \cdot M$ is subsymmetric.

Let us consider n, K and let M_1, M_2 be subsymmetric square matrices over K of dimension n . One can verify that $M_1 - M_2$ is subsymmetric.

Let us consider n, K and let M be a subsymmetric square matrix over K of dimension n . Observe that M^T is subsymmetric.

Let us consider n, K . Observe that every square matrix over K of dimension n which is line circulant is also subsymmetric and every square matrix over K of dimension n which is column circulant is also subsymmetric.

Let K be a field, let n be a natural number, and let M be a square matrix over K of dimension n . We say that M is anti-subsymmetric if and only if:

(Def. 2) For all natural numbers i, j, k, l such that $\langle i, j \rangle \in$ the indices of M and $k = (n + 1) - j$ and $l = (n + 1) - i$ holds $M_{i,j} = -M_{k,l}$.

Let us consider n, K . One can verify that there exists a square matrix over K of dimension n which is anti-subsymmetric.

The following proposition is true

(1) Let K be a Fanoian field, n, i, j, k, l be natural numbers, and M_1 be a square matrix over K of dimension n . Suppose $\langle i, j \rangle \in$ the indices of M_1 and $i + j = n + 1$ and $k = (n + 1) - j$ and $l = (n + 1) - i$ and M_1 is anti-subsymmetric. Then $(M_1)_{i,j} = 0_K$.

Let us consider n, K and let M be an anti-subsymmetric square matrix over K of dimension n . Note that $-M$ is anti-subsymmetric.

Let us consider n, K and let M_1, M_2 be anti-subsymmetric square matrices over K of dimension n . Observe that $M_1 + M_2$ is anti-subsymmetric.

Let us consider n, K, a and let M be an anti-subsymmetric square matrix over K of dimension n . One can verify that $a \cdot M$ is anti-subsymmetric.

Let us consider n, K and let M_1, M_2 be anti-subsymmetric square matrices over K of dimension n . One can check that $M_1 - M_2$ is anti-subsymmetric.

Let us consider n, K and let M be an anti-subsymmetric square matrix over K of dimension n . One can verify that M^T is anti-subsymmetric.

2. BASIC PROPERTIES OF CENTRAL SYMMETRIC MATRICES

Let K be a field, let n be a natural number, and let M be a square matrix over K of dimension n . We say that M is central symmetric if and only if:

(Def. 3) For all natural numbers i, j, k, l such that $\langle i, j \rangle \in$ the indices of M and $k = (n + 1) - i$ and $l = (n + 1) - j$ holds $M_{i,j} = M_{k,l}$.

Let us consider n, K, a . Note that $(a)^{n \times n}$ is central symmetric.

Let us consider n, K . One can verify that there exists a square matrix over K of dimension n which is central symmetric.

Let us consider n, K and let M be a central symmetric square matrix over K of dimension n . One can verify that $-M$ is central symmetric.

Let us consider n, K and let M_1, M_2 be central symmetric square matrices over K of dimension n . One can verify that $M_1 + M_2$ is central symmetric.

Let us consider n, K, a and let M be a central symmetric square matrix over K of dimension n . Note that $a \cdot M$ is central symmetric.

Let us consider n, K and let M_1, M_2 be central symmetric square matrices over K of dimension n . Observe that $M_1 - M_2$ is central symmetric.

Let us consider n, K and let M be a central symmetric square matrix over K of dimension n . Observe that M^T is central symmetric.

Let us consider n, K . Note that every square matrix over K of dimension n which is symmetric and subsymmetric is also central symmetric.

3. BASIC PROPERTIES OF SYMMETRIC CIRCULANT MATRICES

Let K be a set, let M be a matrix over K , and let p be a finite sequence. We say that M is symmetry circulant about p if and only if the conditions (Def. 4) are satisfied.

- (Def. 4)(i) $\text{len } p = \text{width } M$,
- (ii) for all natural numbers i, j such that $\langle i, j \rangle \in$ the indices of M and $i + j \neq \text{len } p + 1$ holds $M_{i,j} = p(((i + j) - 1) \bmod \text{len } p)$, and
- (iii) for all natural numbers i, j such that $\langle i, j \rangle \in$ the indices of M and $i + j = \text{len } p + 1$ holds $M_{i,j} = p(\text{len } p)$.

The following propositions are true:

- (2) $(a)^{n \times n}$ is symmetry circulant about $n \mapsto a$.
- (3) If M_1 is symmetry circulant about p , then $a \cdot M_1$ is symmetry circulant about $a \cdot p$.
- (4) If M_1 is symmetry circulant about p , then $-M_1$ is symmetry circulant about $-p$.
- (5) If M_1 is symmetry circulant about p and M_2 is symmetry circulant about q , then $M_1 + M_2$ is symmetry circulant about $p + q$.

Let K be a set and let M be a matrix over K . We say that M is symmetry circulant if and only if:

- (Def. 5) There exists a finite sequence p of elements of K such that $\text{len } p = \text{width } M$ and M is symmetry circulant about p .

Let K be a non empty set and let p be a finite sequence of elements of K . We say that p is first symmetry of circulant if and only if:

(Def. 6) There exists a square matrix over K of dimension $\text{len } p$ which is symmetry circulant about p .

Let K be a non empty set and let p be a finite sequence of elements of K . Let us assume that p is first symmetry of circulant. The functor $\text{SCirc } p$ yielding a square matrix over K of dimension $\text{len } p$ is defined as follows:

(Def. 7) $\text{SCirc } p$ is symmetry circulant about p .

Let us consider n, K, a . Note that $(a)^{n \times n}$ is symmetry circulant.

Let us consider n, K . Note that there exists a square matrix over K of dimension n which is symmetry circulant.

In the sequel D is a non empty set, t is a finite sequence of elements of D , and A is a square matrix over D of dimension n .

We now state the proposition

(6) Let p be a finite sequence of elements of D . Suppose $0 < n$ and A is symmetry circulant about p . Then A^T is symmetry circulant about p .

Let us consider n, K, a and let M_1 be a symmetry circulant square matrix over K of dimension n . Note that $a \cdot M_1$ is symmetry circulant.

Let us consider n, K and let M_1, M_2 be symmetry circulant square matrices over K of dimension n . Note that $M_1 + M_2$ is symmetry circulant.

Let us consider n, K and let M_1 be a symmetry circulant square matrix over K of dimension n . Note that $-M_1$ is symmetry circulant.

Let us consider n, K and let M_1, M_2 be symmetry circulant square matrices over K of dimension n . Observe that $M_1 - M_2$ is symmetry circulant.

The following propositions are true:

- (7) If A is symmetry circulant and $n > 0$, then A^T is symmetry circulant.
- (8) If p is first symmetry of circulant, then $-p$ is first symmetry of circulant.
- (9) If p is first symmetry of circulant, then $\text{SCirc}(-p) = -\text{SCirc } p$.
- (10) Suppose p is first symmetry of circulant and q is first symmetry of circulant and $\text{len } p = \text{len } q$. Then $p + q$ is first symmetry of circulant.
- (11) If $\text{len } p = \text{len } q$ and p is first symmetry of circulant and q is first symmetry of circulant, then $\text{SCirc}(p + q) = \text{SCirc } p + \text{SCirc } q$.
- (12) If p is first symmetry of circulant, then $a \cdot p$ is first symmetry of circulant.
- (13) If p is first symmetry of circulant, then $\text{SCirc}(a \cdot p) = a \cdot \text{SCirc } p$.
- (14) If p is first symmetry of circulant, then $a \cdot \text{SCirc } p + b \cdot \text{SCirc } p = \text{SCirc}((a + b) \cdot p)$.
- (15) If p is first symmetry of circulant and q is first symmetry of circulant and $\text{len } p = \text{len } q$, then $a \cdot \text{SCirc } p + a \cdot \text{SCirc } q = \text{SCirc}(a \cdot (p + q))$.
- (16) Suppose p is first symmetry of circulant and q is first symmetry of circulant and $\text{len } p = \text{len } q$. Then $a \cdot \text{SCirc } p + b \cdot \text{SCirc } q = \text{SCirc}(a \cdot p + b \cdot q)$.
- (17) If M_1 is symmetry circulant, then $M_1^T = M_1$.

Let us consider n, K . Note that every square matrix over K of dimension n which is symmetry circulant is also symmetric.
