Why subscribe and read

NDS aims at disseminating mathematical research in the field of nonautonomous dynamical systems from both purely mathematical and interdisciplinary point of view. NDS is specially directed to researchers interested in time evolution systems in broad sense who will find the journal as a reference to the field aiming to promote and stimulate the research and development in nonautonomous dynamical systems and related topics.

Why submit

The journal is driven by experts in the field who will assure a peer review process of highest quality. The submission of a manuscript will be understood to mean that the paper is not being considered for publication elsewhere. Incoming papers are acknowledged immediately. Each submission will be managed and reviewed by experts in the field which guarantees highest research level of papers published in the journal. Finally, the open access publishing model has the potential to increase the readership.

Nonautonomous Dynamical Systems (NDS) covers all areas and subareas of nonautonomous dynamical systems. In particular, it encourages interdisciplinary papers that cut across sub-disciplines of nonautonomous dynamical systems to neighboring fields. Those areas include, but are not limited to, differential equations; partial differential equations; chaos theory; bifurcation theory; complex dynamics; stability theory; qualitative theory of differential equations; integro-differential equations; difference equations; fractional differential equations; functional differential equations; stability theory; ergodic theory; numerical analysis; mathematical control theory; and applications to natural and social sciences.
