MOLECULAR BASED MATHEMATICAL BIOLOGY

Ed. by Guowei Wei

MBMB publishes original articles, letters, and reviews that concern the application of mathematical and computational approaches to important problems in molecular biosciences and biophysics, such as biomolecular structure and function, solvation, electrostatics, biomolecular dynamics and transport, ion channels, membrane transporters, macromolecular complexes and their interactions, nucleic acids and genomic biophysics, molecular motors, rational drug design and discovery, etc. All mathematical and computational approaches, including mathematical/theoretical modeling, numerical methods, computational algorithms, mathematical analysis, statistical and stochastic analysis, deep learning, forecasting and prediction, are appropriate.

MBMB welcomes studies of molecular biosciences and biophysics from all areas of mathematical and computational sciences, including differential equations, functional analysis, harmonic analysis, Lie group, Lie algebra, geometry, differential geometry, graph theory, topology, combinatorics, multiscale analysis, inverse problem, optimization, statistics, big data analysis, machine learning, stochastic process, uncertainty quantification, fuzzy logic, statistical inference, nonparametric regression, imaging and visualization technique, and so on.

Why subscribe and read
MBMB is a unique journal that publishes all mathematical and quantitative results concerning the molecular-level biological sciences and biophysics.

Why submit
The journal offers fast, fair and constructive peer review, quick publication upon acceptance and long-time preservation of the contents.

Past Topical/Special Issues
