<i>Introduction</i>	1
Part I. General theory and basic examples	9
<i>Chapter 1 Specifications of random fields</i>	11
1.1 Preliminaries	11
1.2 Prescribing conditional probabilities	15
1.3 λ -specifications	18
<i>Chapter 2 Gibbsian specifications</i>	25
2.1 Potentials	26
2.2 Quasilocality	30
2.3 Gibbs representation of pre-modifications	35
2.4 Equivalence of potentials	39
<i>Chapter 3 Finite state Markov chains as Gibbs measures</i>	44
3.1 Markov specifications on the integers	44
3.2 The one-dimensional Ising model	49
3.A Appendix. Positive matrices	54
<i>Chapter 4 The existence problem</i>	57
4.1 Local convergence of random fields	58
4.2 Existence of cluster points	60
4.3 Continuity results	66
4.4 Existence and topological properties of Gibbs measures	71
4.A Appendix. Standard Borel spaces	73
<i>Chapter 5 Specifications with symmetries</i>	81
5.1 Transformations of specifications	81
5.2 Gibbs measures with symmetries	85
<i>Chapter 6 Three examples of symmetry breaking</i>	94
6.1 Inhomogeneous Ising chains	95

6.2	The Ising ferromagnet in two dimensions	99
6.3	Shlosman's random staircases	106
<i>Chapter 7 Extreme Gibbs measures</i>		114
7.1	Tail triviality and approximation	115
7.2	Some applications	125
7.3	Extreme decomposition	129
7.4	Macroscopic equivalence of Gibbs simplices	136
<i>Chapter 8 Uniqueness</i>		140
8.1	Dobrushin's condition of weak dependence	140
8.2	Further consequences of Dobrushin's condition	153
8.3	Uniqueness in one dimension	164
<i>Chapter 9 Absence of symmetry breaking. Non-existence</i>		168
9.1	Discrete symmetries in one dimension	169
9.2	Continuous symmetries in two dimensions	178
Part II. Markov chains and Gauss fields as Gibbs measures		189
<i>Chapter 10 Markov fields on the integers I</i>		190
10.1	Two-sided and one-sided Markov property	191
10.2	Markov fields which are Markov chains	196
10.3	Uniqueness of the shift-invariant Markov field	204
<i>Chapter 11 Markov fields on the integers II</i>		209
11.1	Boundary laws, uniqueness, and non-existence	210
11.2	The Spitzer-Cox example of phase transition	221
11.3	Kalikow's example of phase transition	228
11.4	Spitzer's example of totally broken shift-invariance	233
<i>Chapter 12 Markov fields on trees</i>		238
12.1	Markov chains and boundary laws	238
12.2	The Ising model on Cayley trees	247
<i>Chapter 13 Gaussian fields</i>		256
13.1	Gauss fields as Gibbs measures	257
13.2	Gibbs measures for Gaussian specifications	267
13.3	The homogeneous case	273
13.A	Appendix. Some tools of Gaussian analysis	284

Part III. Shift-invariant Gibbs measures	289
<i>Chapter 14 Ergodicity</i>	290
14.1 Ergodic random fields	290
14.2 Ergodic Gibbs measures	296
14.A Appendix. The multidimensional ergodic theorem	302
<i>Chapter 15 The specific free energy and its minimization</i>	308
15.1 Relative entropy	309
15.2 Specific entropy	312
15.3 Specific energy and free energy	319
15.4 The variational principle	323
15.5 Large deviations and equivalence of ensembles	327
<i>Chapter 16 Convex geometry and the phase diagram</i>	338
16.1 The pressure and its tangent functionals	338
16.2 A geometric view of Gibbs measures	343
16.3 Phase transitions with prescribed order parameters	348
16.4 Ubiquity of pure phases	359
Part IV. Phase transitions in reflection positive models	365
<i>Chapter 17 Reflection positivity</i>	367
17.1 The chessboard estimate	367
17.2 Gibbs distributions with periodic boundary condition	374
<i>Chapter 18 Low energy oceans and discrete symmetry breaking</i>	382
18.1 Percolation of spin patterns	383
18.2 Discrete symmetry breaking at low temperatures	394
18.3 Examples	398
<i>Chapter 19 Phase transitions without symmetry breaking</i>	408
19.1 Potentials with degenerated ground states, and perturbations thereof	408
19.2 Exploiting Sperner's lemma	415
19.3 Models with an entropy–energy conflict	420
19.A Appendix. Sperner's lemma	431
<i>Chapter 20 Continuous symmetry breaking in N-vector models</i>	433
20.1 Some preliminaries	434
20.2 Spin wave analysis, and spontaneous magnetization	439
