MATERIALS AND METHODS IN THE STUDY OF PROTOZOA

BY
HAROLD KIRBY
Professor of Zoölogy, University of California, Berkeley
"In pursuing our researches we have become practically convinced of the importance of what we have theoretically assumed -- the absolute necessity for prolonged and patient examination of the same forms. Two observers, independently of each other, examining the same monad, if their inquiries were not sufficiently prolonged, might, with the utmost truthfulness of interpretation, assert opposite modes of development. Competent optical means, careful interpretation, close observation, and time are alone capable of solving the problem." -- Dallinger and Drysdale, 1874
